

## Hoses for Low/Medium Pressures

Whilst apparently simpler, given the smaller pressure range, these hoses are used in a vast variety of sectors.

One of these sectors to which we pay special attention is diving, covered by the production of DIVER hoses, certified to standard EN 250:2000, in both rubber and thermoplastic, used for aqualungs and diving jackets.

In addition to the essential demand for reliability, due to the potential consequences of failure, this line of hoses also requires a considerable eye to aesthetics, leading to a need for extra high quality components.

For the automotive sector and particularly for diesel engines, there is a line especially designed to convey oil at temperatures of up to 150°C, and the most aggressive ecology fuels (biodiesel) up to B100, as well as hoses for lead-free petrol and for cooling systems, to standard UNI ISO 4081:2005.

Hoses for compressed air up to 20 bars and for the delivery and return transfer of fuels and oils are another important element of our production.
